Biography

Wenhao Peng is an RF acoustic wave filter technology engineer at Skyworks Solutions, working across device modeling, filter design, and high-volume manufacturing of bulk acoustic wave (BAW) resonators and filters. His work spans thin-film piezoelectric and ferroelectric materials, including aluminum nitride, scandium-doped aluminum nitride, and barium strontium titanate, applied to intrinsically switchable filters and millimeter-wave FBARs. Two methods run through it. Finite element analysis, which he brought into the thermodynamic modeling of ferroelectrics to derive the first equivalent-circuit model of ferroelectric-driven BAW resonators from first principles; and modal analysis, which he used to prove how the Berlincourt field-based and resonance-based definitions of electromechanical coupling relate, and now applies in the reverse direction to cut the cost of finite element simulation so it can support production filter design. He also demonstrated the first FBARs operating above 50 GHz, using periodically poled AlN/ScAlN/AlN trilayers. He received the Ph.D. degree in electrical and computer engineering from the University of Michigan, Ann Arbor, in 2026.

Selected Contributions

- | | |
|------------------------|--|
| Modal analysis | Proved the analytical relation between the two standard definitions of electromechanical coupling (k_t^2): the Berlincourt form computed from acoustic field distributions, and the form determined from the series and parallel resonance frequencies. Derived by modal analysis of the open-circuit eigenmodes of an FBAR, answering a question the literature had left open. The result makes acoustic field plots quantitatively interpretable, showing what a given mode contributes to resonator coupling, and converts layer stack design from iterative optimization against simulated admittance into direct evaluation. Quoted in both mm-wave FBAR papers, with the derivation presented at IMS 2024 and IMS 2025; now extended to cut finite element simulation cost in production filter design (see Experience). |
| Finite element methods | Adapted interpolation methods from finite element analysis into the thermodynamic modeling of ferroelectrics, bridging a bulk thermodynamic description and a compact circuit representation. Produced the first equivalent-circuit model of ferroelectric-driven BAW resonators derived from first principles rather than empirical fitting, reproducing measured response across DC bias. First author, IEEE TMTT 2022 and IMS 2021. |
| mm-Wave scaling | First FBAR demonstrated above 50 GHz: a 56 GHz periodically poled AlN/ScAlN/AlN trilayer, extending BAW operation roughly five times beyond the prior state of the art below 10 GHz. A second-generation 36 GHz device applied the modal analysis result above to electrode and layer stack selection. First author on both (IMS 2024, IMS 2025). Built on co-demonstrated controlled ferroelectric polarization switching in ultrawide-bandgap AlN/ScAlN multilayers (Applied Physics Letters 2023). |
| Switchless frontends | Co-developed the first switchless quad-band filter bank built on ferroelectric BST FBARs. Related work produced the first intrinsically switchable balanced ferroelectric FBAR filter and the first RF acoustic phase inversion switch based on poled ferroelectrics. |

Experience

- Feb 2026–Present **RF Acoustic Staff Electrical Engineer**, *Skyworks Solutions, Inc.*, Irvine, CA.
- Serve as technical bridge across device modeling, filter design, and high-volume manufacturing, applying equivalent-circuit and multiphysics modeling to guide design decisions and troubleshoot performance across the design-to-production pipeline.
 - Contribute to resonator stack design and optimization for higher-frequency cellular bands, balancing performance, tunability, and manufacturability requirements.
 - Extending the modal analysis methods developed in thesis work to reduce the computational cost of finite element acoustic simulation, with the goal of making mask-level response prediction deployable inside the filter design flow, where full finite element simulation had previously been impractical on runtime and cost grounds (ongoing R&D).
 - Work with modeling, process, and production teams to align design targets with fab capability and yield.
- Sep 2019–Dec 2025 **Graduate Student Research Assistant**, *University of Michigan*, Ann Arbor, MI.
Advisor: Prof. Amir Mortazawi
- 2025 *mm-Wave acoustic resonators based on periodically poled III-nitride thin films*
- Demonstrated the first mm-wave FBARs using AlN/ScAlN/AlN periodically poled trilayers, including the first device of this class operating above 50 GHz (56 GHz), followed by a second-generation 36 GHz resonator with a redesigned electrode and layer stack. On-wafer characterization in the dissertation gives $k_t^2 = 1.7\%$, $Q_m = 53$ at 56 GHz and $k_t^2 = 2.9\%$, $Q_m = 102$ at 36 GHz.
 - Proved the Berlincourt-to-resonance-frequency coupling relation described above, as the theoretical groundwork for the device work, replacing iterative optimization against admittance responses with direct evaluation.
 - Advanced the nanofabrication and pulsed-field polarization-switching processes, including current-response analysis.
 - Performed mm-wave characterization to 67 GHz with on-wafer de-embedding structures validated in ADS Momentum and Ansys HFSS.
- Reconfigurable RF frontends based on intrinsically switchable BST acoustic resonators*
- Built the first equivalent-circuit model of ferroelectric-driven BAW resonators grounded in ferroelectric thermodynamics, adapting interpolation methods from finite element analysis to bridge the bulk thermodynamic description and a compact circuit representation, and capturing the underlying physics rather than fitting measured response. Validated by direct overlay of simulated and measured response across DC bias.
 - Contributed to the first switchless quad-band BST FBAR filter bank and the first intrinsically switchable balanced ferroelectric FBAR filter at 2 GHz.
 - Contributed to the first RF acoustic phase inversion switch based on poled-ferroelectric stacked crystal filters.
 - Synthesized filters by the image parameter method, applying Mason and mBVD resonator models, then carried them through full cleanroom fabrication and DC-bias-dependent characterization.

Education

- 2026 **Ph.D., Electrical and Computer Engineering**, *University of Michigan*, Ann Arbor, MI.
Dissertation: *Layered Ferroelectric Millimeter-Wave BAW Resonators: Modeling and Validation based on On-Wafer Characterization*. Advisor: Prof. Amir Mortazawi.
- 2024 **M.S.E., Mechanical Engineering**, *University of Michigan*, Ann Arbor, MI.
Dynamics and vibrations
- 2019 **M.S., Electrical and Computer Engineering**, *University of Michigan*, Ann Arbor, MI.
Integrated circuits and VLSI

- 2018 **B.S.E., Electrical Engineering**, *University of Michigan*, Ann Arbor, MI.
Summa Cum Laude
- 2018 **B.S.E., Electrical and Computer Engineering**, *Shanghai Jiao Tong University*,
Shanghai, China.
Dual degree with U-M

Technical Skills

Devices & materials	BAW/FBAR resonator and filter design; thin-film piezoelectrics and ferroelectrics (AlN, ScAlN, BST); periodically poled III-nitride multilayers; MEMS; RF frontend architectures
Modeling	Mason and mBVD equivalent circuits; thermodynamic modeling of ferroelectric nonlinearity; modal analysis; image-parameter filter synthesis; multiphysics FEM (COMSOL); EM co-simulation (ADS Momentum, Ansys HFSS); structural vibration analysis
Fabrication	Cleanroom process integration; photolithography; physical vapor deposition; wet/dry/plasma etching; thermal oxidation; device processing compatible with MBE-grown films; pulsed-field poling
Measurement	On-wafer S-parameter characterization to 67 GHz; GSG probing; VNA calibration and de-embedding; DC-bias-dependent RF characterization; material parameter extraction
Tools	ADS, COMSOL Multiphysics, Ansys HFSS, MATLAB, Python, Cadence, LLM
